IBM Security Assessment Services

IBM Enterprise Security Framework

IBM provides an end to end lifecycle of security services, based on industry standards and the IBM Enterprise Security Framework.

Our assessment and planning services range from assessing the maturity and completeness of your organisation’s approach to IT Security to assessing specific components, such as network applications, systems and the Internet. Since security involves all parts of your business, we also go beyond the electronic and network concerns and include physical site security.

The bottom line is that after our assessments, you’ll know the relative strengths and weaknesses in your environment. We can also help you to plan, design, implement and run the IT Security solutions needed for your organisation.

Assessment Services

Our assessment services include:

- Organisational Security Maturity Assessment
- Security Programme Assessment
- Security Policy and Process Assessment
- Security Compliance Assessment
- Privacy Readiness Assessment
- Application Security Assessment
- Internet Security Assessment
- Network Security Assessment
- System Security Assessment
- Ethical Hacking and Penetration Testing
- Computer Forensic and Investigation Services
- Wireless Security Assessment
- Site Security Assessment
- Business Resilience and Continuity Capability Assessment.

We can readily tailor the scope and depth of our assessment services to your particular requirements.

About IBM Security and Privacy Services

As one of the leading providers of security services, with research and development labs around the world, IBM brings a wealth of experience to any organisation. We do this by utilising a consistent and tested methodology, supported by unique combination of local expertise, international resources and industry specific solutions. This synergy leverages the substantial wealth of IBM’s intellectual capital, methodology and competencies to meet short and long term strategic business requirements.

Our security specialists design and deliver solutions that help organisations assess security needs, protect data assets, detect threats and intrusions and recover from incidents as well as managing security needs across the enterprise.
